Update and state of the pilot

Biodiversa+ BiodivPond Pilot online
meeting

September 11th 2026, online

Agenda points

- Data uploads
- Blog posts
- Acoustic recorder unit deployment duration
- Reporting ARU issues
- Next meeting – NEWTCAM presentation

Data uploads

- Bulgaria still needs to send both forms(!)
- Submit data for repeated traditional sampling
- Once you receive the water analysis results, upload them on Google Drive, please (no need to change the format) - thanks to Sweden, Bozen, Israel, and Denmark

Update site characteristics

- Update the details in the Core pond selection spreadsheet - Flanders, Bulgaria, Denmark, and Slovakia
- If the pond depth is unknown, fill that it too (NA)
- Indicate which voluntary actions were really done (eg. macrophyte survey)

Land cover around BiodivPond monitoring sites

Share of CORINE Land Cover categories within 500 m / 1000 m / 5000 m buffers (Israel sites omitted - outside CORINE coverage)

Storytelling time

- We have a webpage biodivpond.github.io
- Webpage primarily for data signposting, but stories and experience is also very valuable
- Blog posts welcome!

Acoustic recorder deployment

- Keep the devices in the field to capture the autumn migration
- Consult with your bat experts (end of October for central Europe)
- In the mediterranean climate, you can opt-in to keep the devices running through winter, if relevant to the bat activity

Communication with Wildlife Acoustics

- A detailed description of all the issues encountered was sent to the manufacturer
- I am not really satisfied with their response (eg. openly admit to be behind with the Android app development)
- 3 year warranty on the SM5BAT – should we use it?

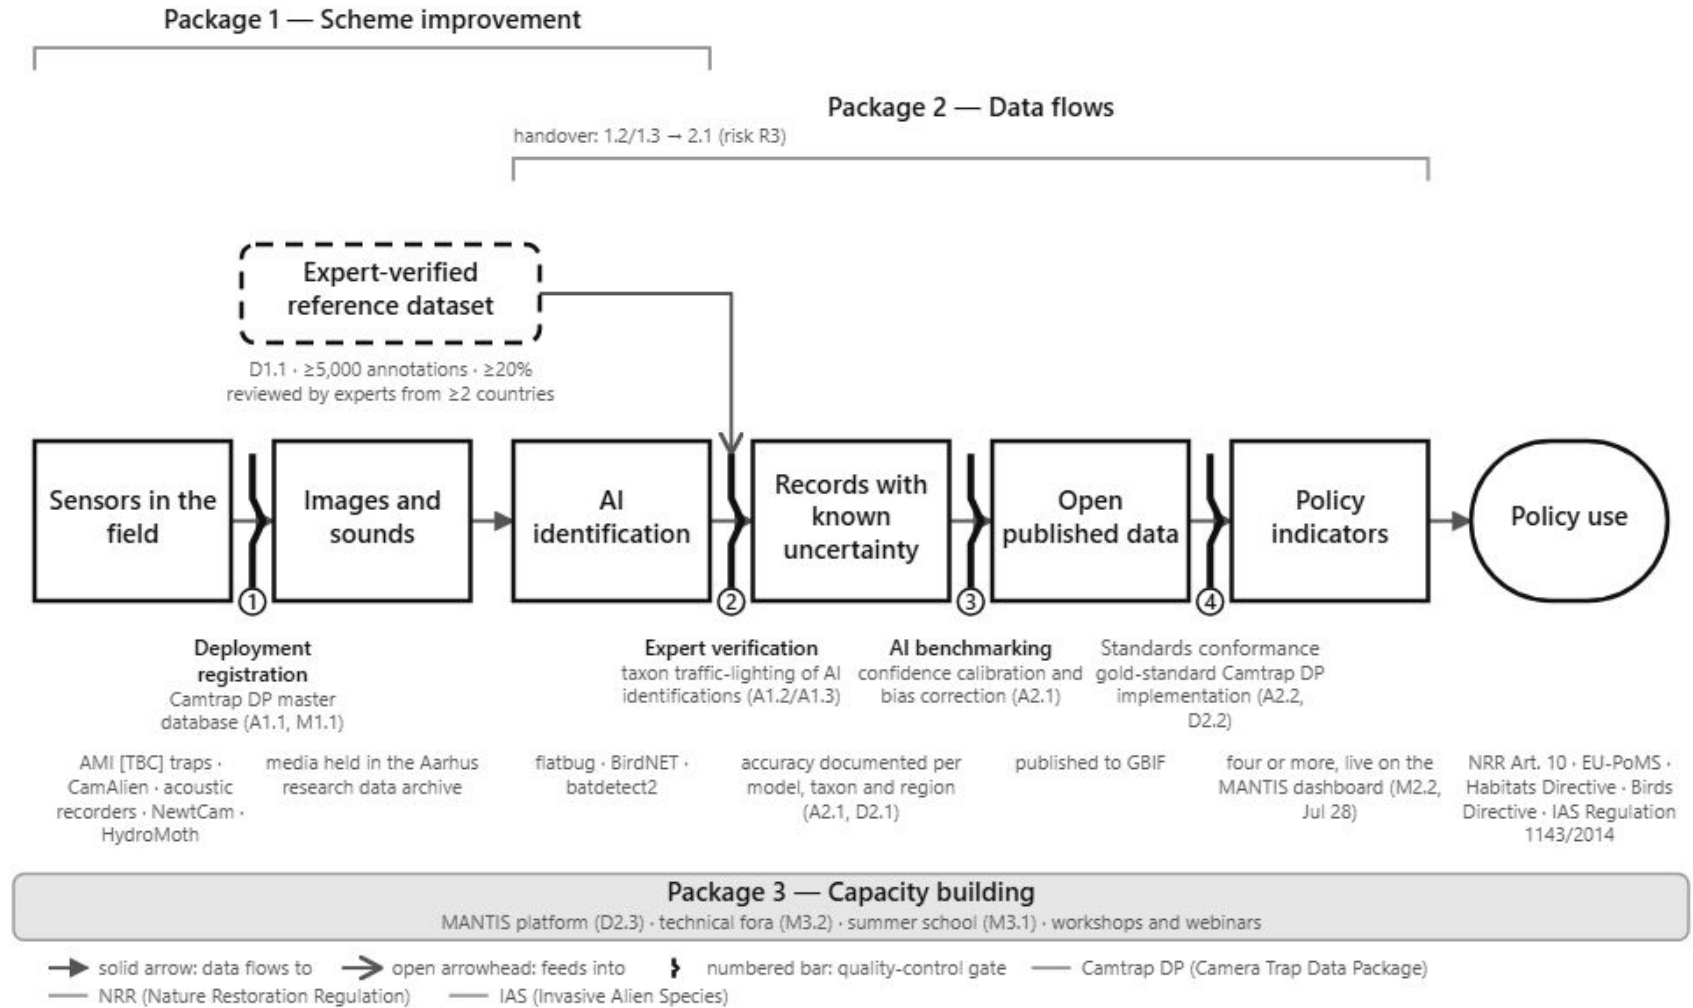

MANTIS: A hub for Monitoring with Automated and Novel Technologies based on Image and Sound

- Sensors are already in the ground across Europe.
- MANTIS builds the connective tissue that turns them into one connected, transnational monitoring system rather than isolated national deployments.

MANTIS runs a single quality-controlled chain from sensors in the field to policy indicators.

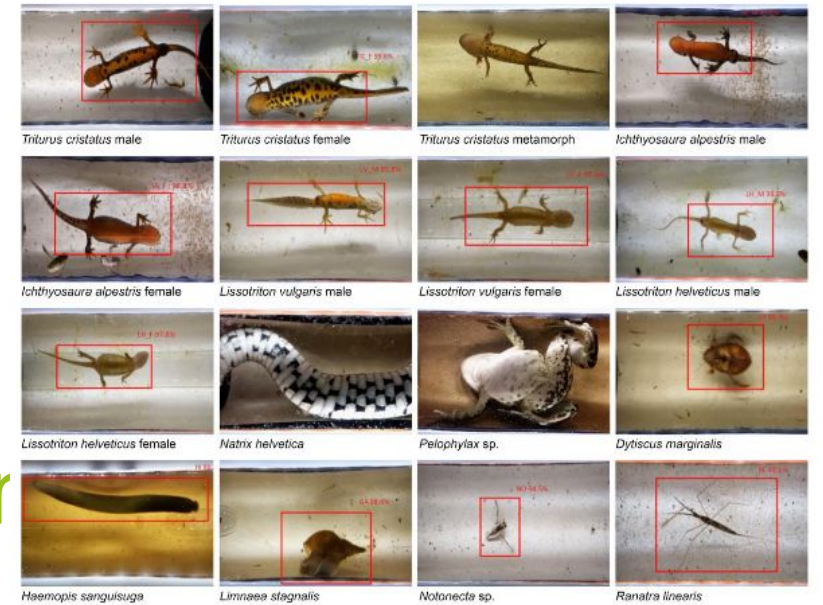

- Package 1 improves the schemes that feed the chain
- Package 2 carries data through verification, benchmarking and publication, and
- Package 3 builds the capacity that keeps it running.

MANTIS is one quality-controlled chain from a sensor in the field to a policy indicator, and the three packages each own a different stretch of it.

Next meeting: Xavier Mestdagh or NEWTCAM

- Luxembourg Institute of Science and Technology
- Presentation of the technology
- Options of lending the device to the BiodivPond partners
